

1. The == operator is used when two things have the same state e.a. null == 0.
With the === operator two things have to be identical e.a. false === false.
2. Closure makes it possible to access a variable outside of the scope where it was created, by using a function that makes it possible to access the variable
3. Function that act upon a different function
4. A query selector takes an argument as a string that refers to a html style and returns an array with the elements matching the html style
document.querySelectorAll("p")
➔ Returns all elements that are labelled <p>...</p>
